Bacteria can double every 20 minutes on a standard surface, and a single microbe can split into 35 billion microbes over the course of 12 hours (36 x in 12hrs).

$$\underbrace{2 \times 2 = 4}_{20mins}; \underbrace{4 \times 4 = 16}_{40mins}; \underbrace{16 \times 16 = 256}_{60mins}; \underbrace{256 \times 256 = 65536}_{80mins}; \dots$$

Anti-bacterial surfaces contribute to the prevention of spreading harmful bacteria. Bacteria does not grow or expand on an anti-bacterial surface, and 99% will naturally perish within 24 hours.

Please note: Anti-bacterial surfaces are not Anti-viral, there-fore they do not protect against Covid-19. Always use disinfectants that are EPA approved to clean and help prevent the spread of Covid-19.
